

AGENCY FOR HEALTHCARE RESEARCH AND QUALITY

AHRQ National Web Conference on Clinical Decision Support Efforts That Assist Clinical Cognitive Processes

Presented by:

A. Zach Hettinger, MD, MS, FACEP
Anping Xie, PhD
Yalini Senathirajah, PhD

Moderated by:

Roland Gamache, PhD, MBA, FAMIA
Agency for Healthcare Research and Quality

October 19, 2021

Agenda

- Welcome and Introductions
- Presentations
- Q&A Session With Presenters
- Instructions for Obtaining CME Credits

Note: You will be notified by email once the slides and recording are available.

Presenter and Moderator Disclosures

A. Zach Hettinger, MD
Presenter

Anping Xie, PhD
Presenter

Yalini Senathirajah, PhD
Presenter

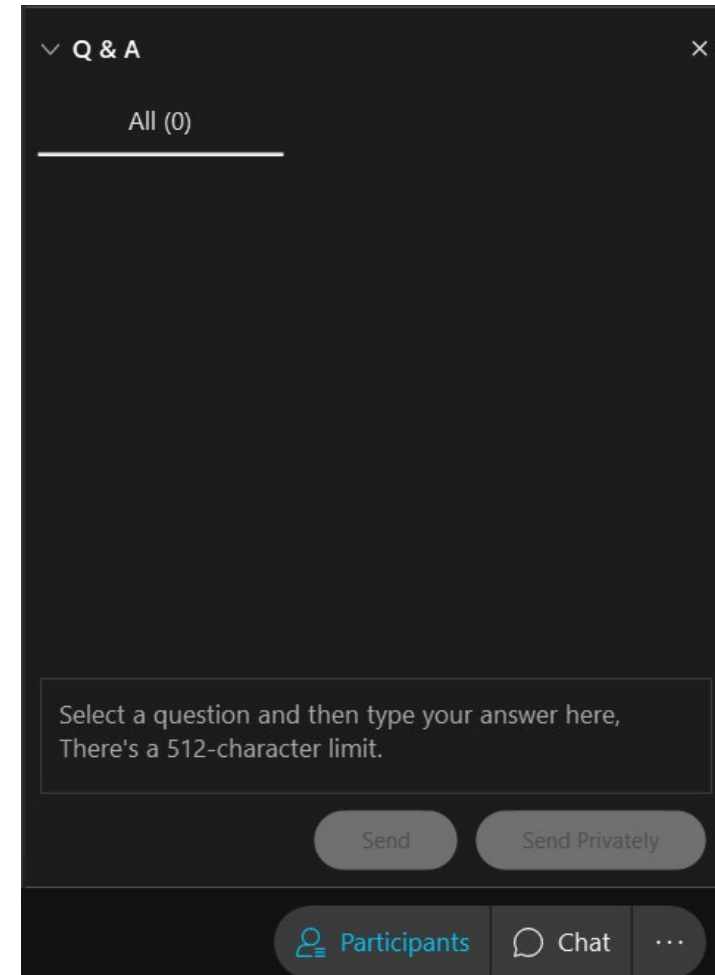

Roland Gamache, PhD
Moderator

This continuing education activity is managed and accredited by AffinityCE, in cooperation with AHRQ and TISTA.

- Panelist Disclosures: Dr. Hettinger, Dr. Xie, and Dr. Senathirajah have no relevant financial interests to disclose.
- Moderator Disclosures: Dr. Gamache has no relevant financial interests to disclose.
- AffinityCE, TISTA and AHRQ staff, as well as planners and reviewers, have no relevant financial interests to disclose.
- Commercial support was not received for this activity.

How to Submit a Question

- At any time during the presentation, type your question into the “Q&A” section of your WebEx Q&A panel.
- Please address your questions to “All Panelists” in the drop-down menu.
- Please include the presenter’s name or their presentation order number (first, second, or third) with your question.
- Select “Send” to submit your question to the moderator.
- Questions will be read aloud by the moderator.

A screenshot of the WebEx Q&A interface. At the top, it says "Q & A" with a dropdown arrow and a close button. Below that, it says "All (0)". There is a large text input area. At the bottom of the input area, it says "Select a question and then type your answer here, There's a 512-character limit." Below the input area are two buttons: "Send" and "Send Privately". At the very bottom, there are three buttons: "Participants" (with a person icon), "Chat" (with a speech bubble icon), and a menu icon (three dots).

Learning Objectives

At the conclusion of this web conference, participants should be able to:

1. Describe the role of cognitive engineering for complex decision making and problem solving in acute care and understand the application of these tools as part of CDS development.
2. Explain and apply the strengths of analytical and naturalistic decision making in the design of effective CDS tools.
3. Review interaction design in electronic health records and how a 'composable' approach helps solve problems of display fragmentation and the related impact on clinical cognitive load and clinical reasoning.

AGENCY FOR HEALTHCARE RESEARCH AND QUALITY

Applying Cognitive Support to the Emergency Department Using Human Factors Engineering

A. Zach Hettinger, MD, MS, FACEP, FAMIA

Director, MedStar Health Center for Biostatistics, Informatics, and Data Science

Director of Cognitive Informatics, MedStar Health National Center for Human Factors in Healthcare

Assistant Professor of Emergency Medicine, Georgetown University School of Medicine

Funding Disclosures

- **AHRQ (R01 HS22542 Cognitive Engineering for Complex Decision Making & Problem Solving in Acute Care)**
- General Research Funding
 - ▶ FDA
 - ▶ ONC
 - ▶ NIH
 - ▶ VA/DoD
 - ▶ PEW Charitable Trust/AMA

Learning Objectives

- Attendees will:
 - ▶ Obtain a brief primer on human factors engineering and potential value in healthcare
 - ▶ Appreciate the role of cognitive support and risk for errors
 - ▶ Review case examples of cognitive support in health IT systems

AGENCY FOR HEALTHCARE RESEARCH AND QUALITY

Brief Introduction To: **Human Factors Engineering**

Human Factors Engineering (HFE)

- “Designing for human use”
 - ▶ Human-Machine Interface (display, control)
- Optimizes the relationship between technology and the human user
- Designs the system to match abilities
- Data-driven, evidence-based
- Normal in aviation, nuclear, military

Better Design – Push Bar

Unexplained Apnea Under Anesthesia

<https://psnet.ahrq.gov/web-mm/unexplained-apnea-under-anesthesia>

User Interface Design

Context Independent

- Font Sizes
- Icons
- Colors & Contrast
- Layout

Cognitive Task Support

Context Dependent

- Workflow Design
- Visualization
- Memory Aids
- Error Anticipation

Cognitive Task Support for Writing Orders

Ratwani RM, Savage E, Will A, Arnold R, Khairat S, Miller K, Fairbanks RJ, Hodgkins M, Hettinger AZ. A usability and safety analysis of electronic health records: a multi-center study. *Journal of the American Medical Informatics Association*. 2018 Jul 2;25(9):1197-201.

Table 2. Summary of duration, clicks, and accuracy

EHR functions	Usability and safety metrics	Site 1A Mean (SD)	Site 2A Mean (SD)	Site 3B Mean (SD)	Site 4B Mean (SD)
X-ray (left elbow, wrist, forearm)	Task duration (sec)	64.1 (22.4)	24.3 (8.5)	33.3 (9.9)	55.5 (13.3)
	Clicks	31.1 (12.6)	7.7 (3.8)	8.1 (4.9)	15.5 (6.6)
	Error rate	25%	16.7%	35.7%	20%
	Types of errors:				
	- <i>Wrong-site x-ray ordered</i> - <i>Omission of one part of the order (eg, forearm)</i>				
MRI (cervical, thoracic, lumbar)	Task duration (sec)	78.9 (33.4)	66 (25.6)	32.2 (16.1)	79.5 (34.3)
	Clicks	28.9 (13.7)	22.4 (10.5)	14.2 (18.2)	33.3 (15.7)
	Error rate	0	8.3%	7.1%	10%
	Types of errors:				
	- <i>Omission of one part of the order (eg cervical)</i>				
Troponin	Task duration (sec)	5.3 (10.3)	14.2 (24.5)	1.5 (.9)	12.1 (19.7)
	Clicks	2.7 (2.9)	4.3 (9.4)	.9 (.9)	8.2 (16.3)
	Error rate	0	0	0	0
	Types of errors: <i>None</i>				
Lactate (timed order)	Task duration (sec)	20.4 (8)	26.9 (7.9)	12.1 (4.9)	17.5 (15.1)
	Clicks	9.9 (3)	11.1 (3.4)	6 (2.5)	6.6 (5.5)
	Error rate	0	0	14.3%	0
	Types of errors:				
	- <i>Ordered for wrong time</i> - <i>Ordered unnecessary tests</i>				
Tylenol (500 mg PO, 4-6 hours)	Task duration (sec)	51.4 (15.3)	70.4 (32)	69.3 (38.2)	45.6 (15.9)
	Clicks	14 (4.1)	23.5 (15.8)	61.6 (94)	25.8 (11.2)
	Error rate	8.3%	0	7.1%	30%
	Types of errors:				
	- <i>Wrong dose, frequency, route, and rate</i>				
Prednisone taper (60 mg, reduce by 10 mg every 2 days for 12 days)	Task duration (sec)	148.6 (76.1)	152.7 (163.4)	175.1 (73)	178.7 (62.6)
	Clicks	32.2 (16.6)	20 (32.8)	42.3 (17.6)	28.2 (5.7)
	Error rate	16.7%	41.7%	50%	40%
	Types of errors:				
	- <i>Wrong dose</i>				

AGENCY FOR HEALTHCARE RESEARCH AND QUALITY

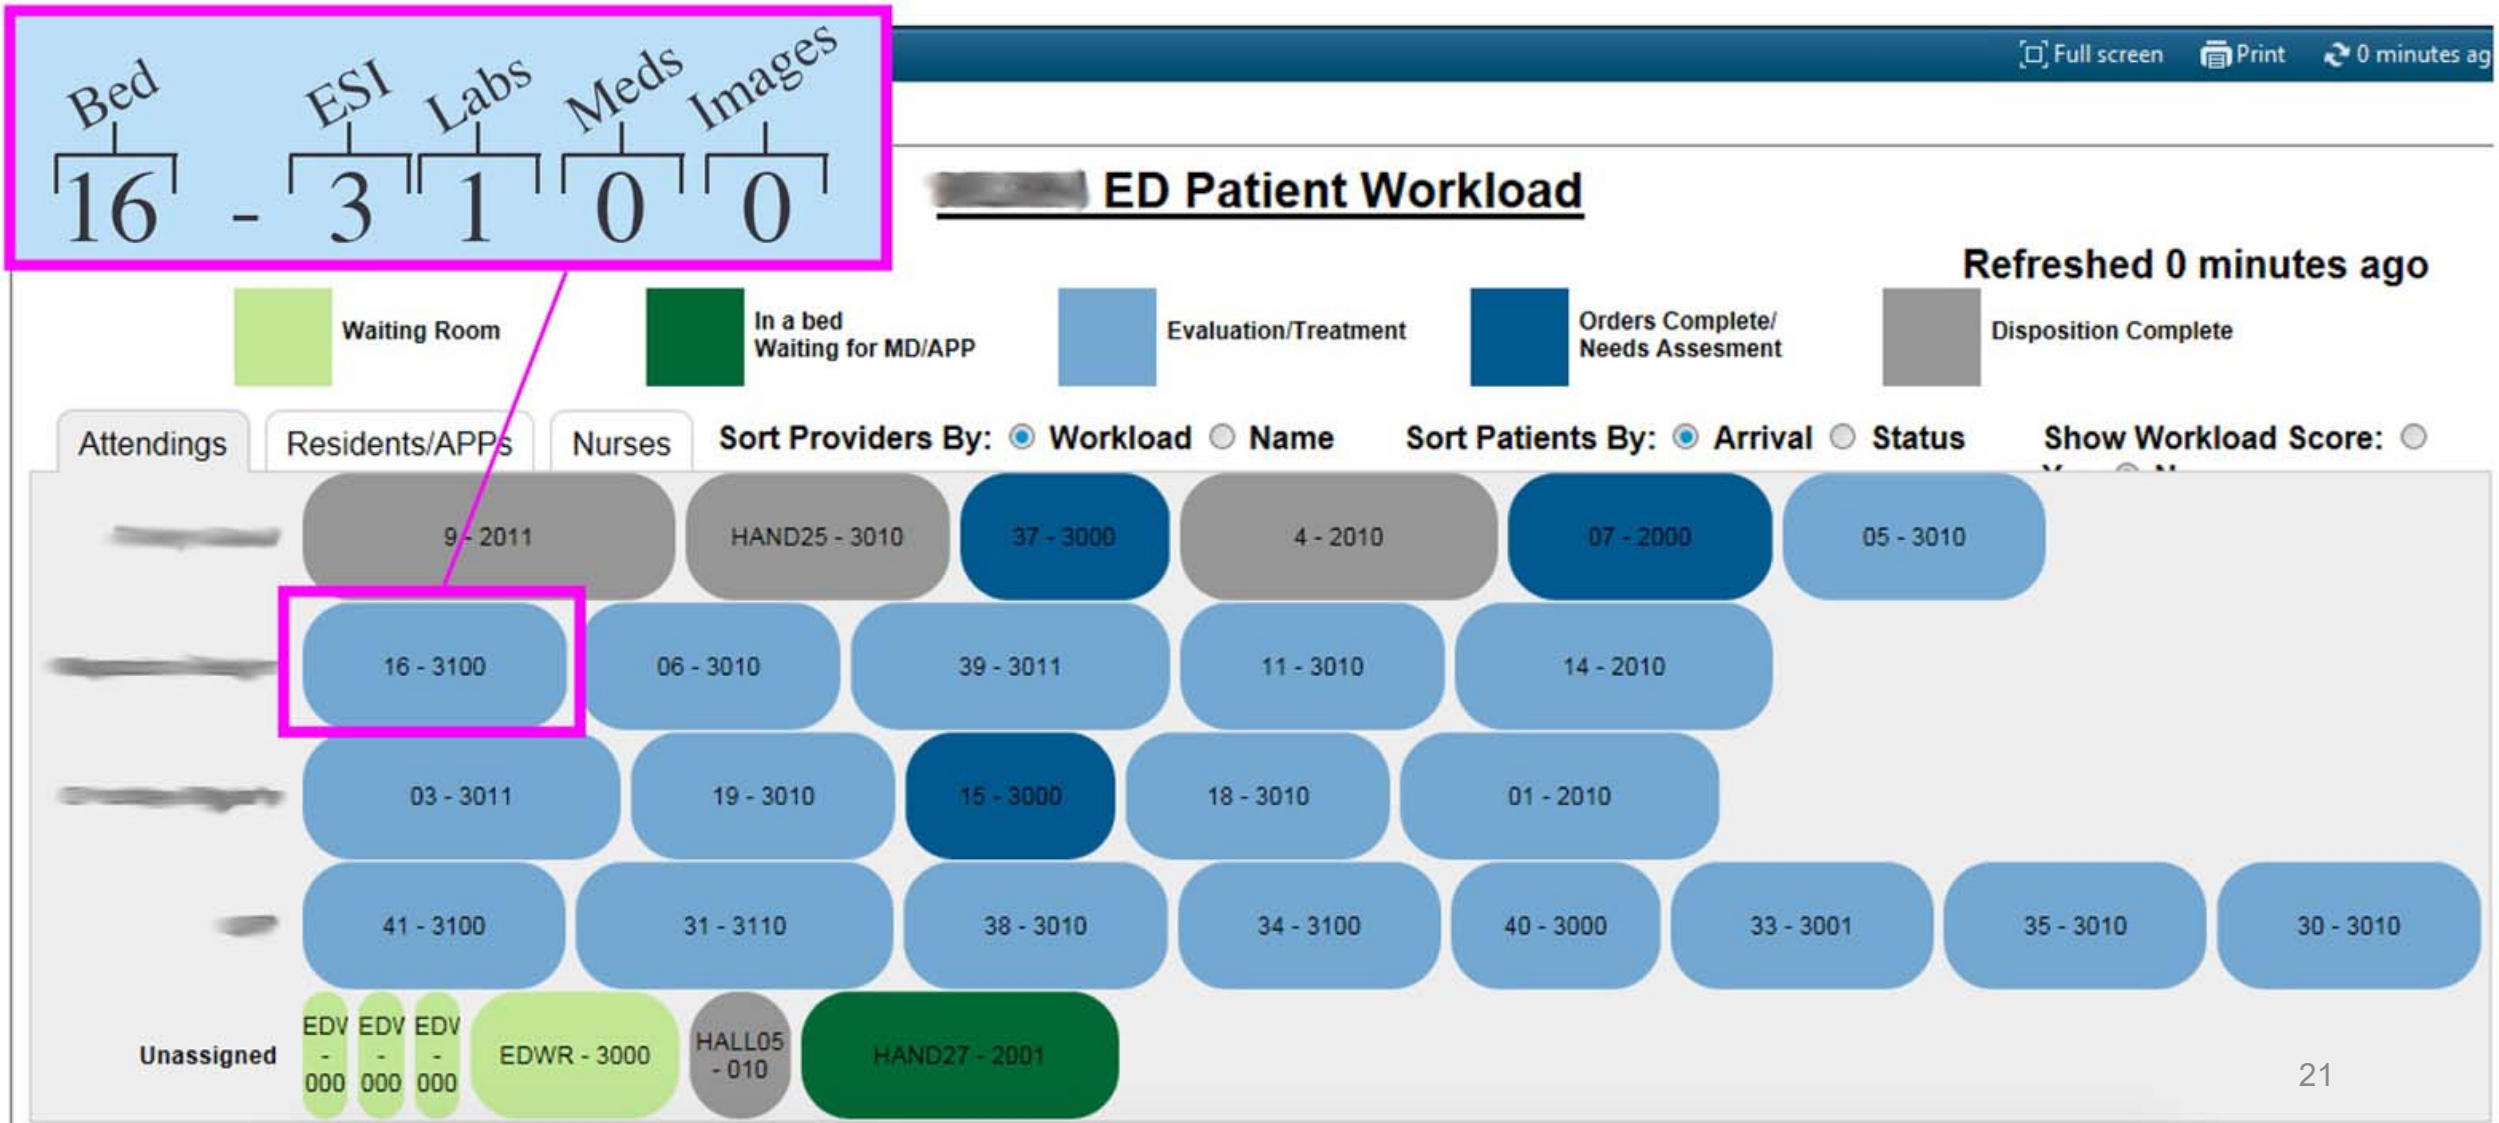

Providing Cognitive Support in the Emergency Department

Cognitive Engineering for Complex Decision Making & Problem Solving in Acute Care

- Cognitive needs and decision making of nurses, physicians, and advance practice providers in the ED.
- Mixed Methods Approach:
 - ▶ Interviews & Focus Groups
 - ▶ Ethnographic Observations & Cognitive Task Analysis
 - ▶ EHR Data & Prototype Design

Cognitive Support - ED Triage/Workload

Cognitive Support - Time Ordered Events

AGENCY FOR HEALTHCARE RESEARCH AND QUALITY

Cognitive and Macro Ergonomics in Clinical Decision Support Design and Dissemination

Anping Xie, PhD

Assistant Professor, Armstrong Institute for Patient Safety and Quality
Johns Hopkins School of Medicine

Objectives

- Brief introduction to the discipline of Human Factors and Ergonomics (HFE) and its domains of specialization
- An example of HFE application to the design and dissemination of CDS tool for blood culture decision-making in sepsis diagnosis
 - ▶ Cognitive ergonomics work informing the integration of CDS tool into EHR
 - ▶ Macro-ergonomics work informing the dissemination of CDS tool

Human Factors and Ergonomics (HFE)

“... the scientific discipline concerned with the understanding of **interactions among humans and other elements of a system**, and the profession that applies theory, principles, data, and methods to **design** in order to **optimize human well-being and overall system performance.**”

- International Ergonomics Association

Domains of Specialization

Clinical Decision Support for Blood Culture Use in Pediatric Sepsis Diagnosis

Funded by AHRQ (R21HS025238, R18 HS025642)

Background

- Blood culture - a key test for sepsis diagnosis
- Perceived as a low-risk test for a disease with disastrous outcomes
- Overuse of blood cultures resulting in
 - ▶ Additional tests
 - ▶ Unnecessary antibiotic use
 - ▶ Prolonged hospitalization
 - ▶ Increased healthcare costs

HFE Applications

- Integration of the blood culture checklist into electronic health records (EHRs)
- Dissemination of the blood culture checklist

HFE Applications

- Integration of the blood culture checklist into electronic health records (EHRs)
- Dissemination of the blood culture checklist

Critical Decision Method Interviews

- Weekly chart review to identify cases where a patient has
 - ▶ Fever and blood culture ordered
 - ▶ Fever but no blood culture ordered
 - ▶ No fever but blood culture ordered
- Interviewing clinicians involved in identified cases
 - ▶ 19 clinicians at Johns Hopkins Hospital (9 physicians, 4 nurse practitioners, 5 nurses, 1 nurse manager)
 - ▶ 37 cases (18 with fever and blood culture ordered, 2 with fever but no blood culture ordered, 17 with no fever but blood culture ordered)
 - ▶ Reviewing and discussing 1-3 cases during interviews

Critical Decision Method Interviews

PICU Pt. Timeline:

(For Interview re: BC Use and Sepsis Diagnosis)

Pt. Summary (at time of fever/hypothermia and/or BC):

Pt. was admitted to 11S on **7.4.2017** from the ED and last transferred onto the PICU **9.1.2017**.

Pt. is a 24 y.o. female with HLH diagnosed 5/2017, treated with Etoposide and Decadron, Graves Disease s/p ablation and acquired hypothyroidism, RAD, Acne, Dry Eye Syndrome, mononucleosis who was admitted to the Oncology service on 8/23 for management of HLH flare and preparation for BMT. She now has multi organ dysfunction who remains on ECMO (**9/8**) support and CVVHD for renal failure.

Pt. has 3 arterial lines, and peripheral lines, implanted port, CVC double lumen, Hemodialysis access central line internal jugular dual lumen; non tunneled,

9.16.17 1050 BC (Arterial) **Staphylococcus species, coagulase negative** (Pt. was pan cultured due to hypotensive episode (and cefepime was escalated to meropenem. Pt. on vanc., acyclovir and ampicillin)

9.17.17 0826 BC (Arterial) **Staphylococcus species, coagulase negative**

9.17.18-9.18.17 (overnight): Catherine had two episodes of hypotension and treated with albumin, epinephrine and calcium chloride

9.18.17 ECMO started to be weaned (Intermittently hypotensive with episodes of arrhythmias, had V-tach overnight)

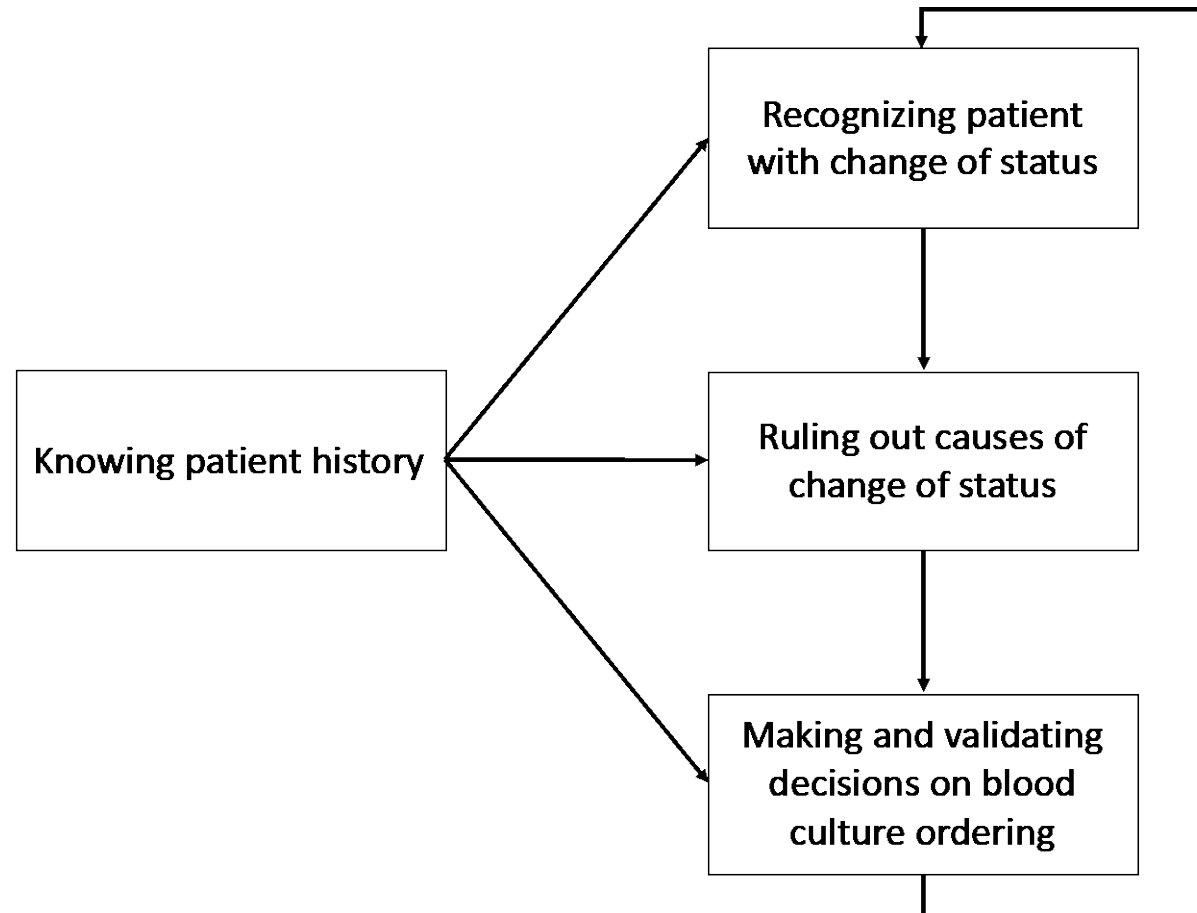

9.18.17 1922 Central line BC **Staphylococcus species, coagulase negative**

9.21.17 0156 **Pseudomonas aeruginosa**

(Include (when applicable): date of admission, primary diagnosis, date/time of fever/hypothermia, date/time of BC, discharge date)

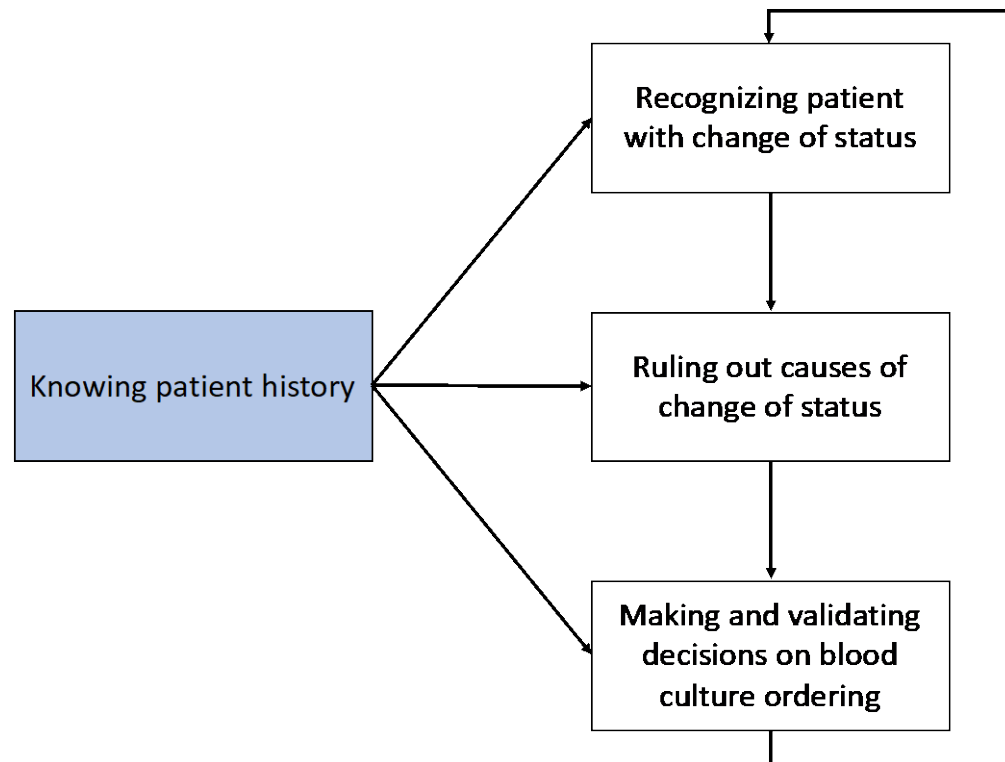

Critical Decision Method Interviews

- Results

Critical Decision Method Interviews

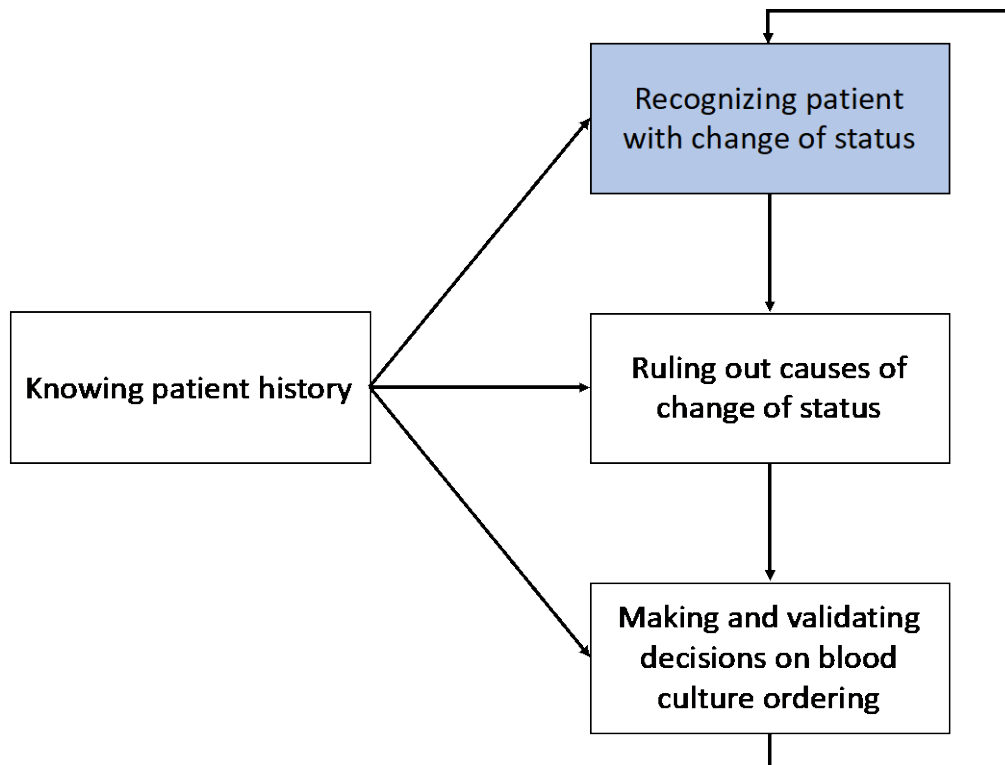

- Results

- ▶ Approaches
 - ▶ Long-term knowledge about a patient
 - ▶ Daily review of patient conditions
- ▶ Potential challenges
 - ▶ New providers or providers covering for others not having knowledge about a patient
 - ▶ Patient information scattered across different sources
- ▶ Implications
 - ▶ Summarizing patient information available in EHRs
 - ▶ Indicating other sources of patient information

Critical Decision Method Interviews

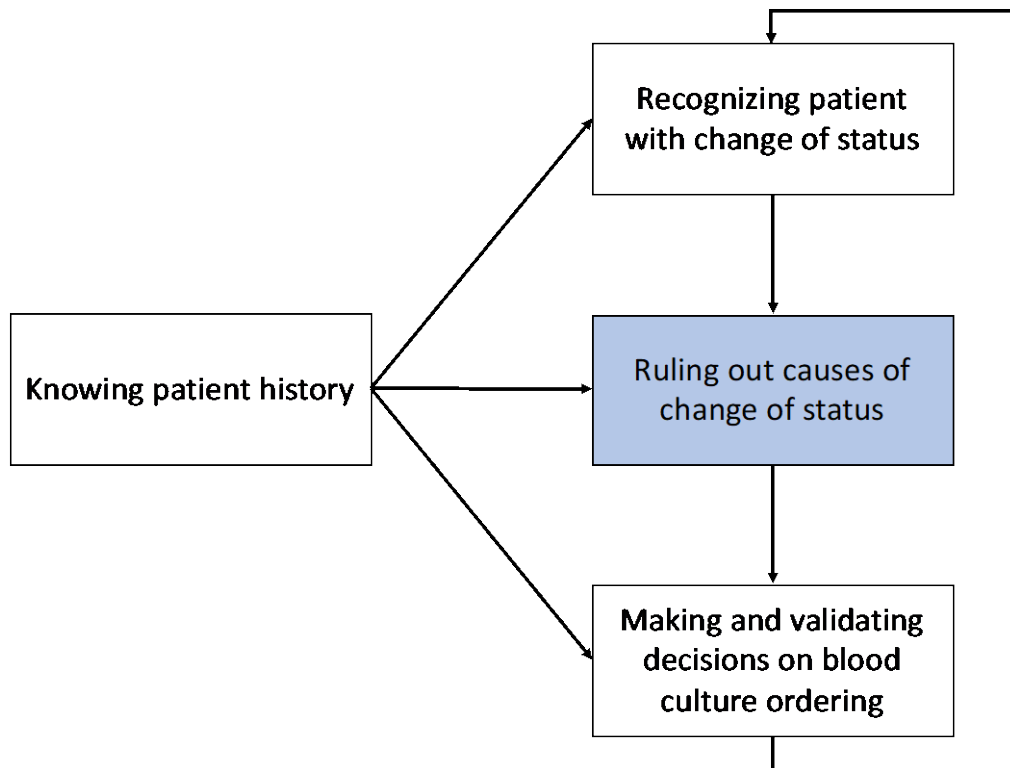

- Results

- ▶ Approaches
 - ▶ Monitoring change of clinical indicators (analytical)
 - ▶ Matching patient conditions with clinical patterns learned from past experience (intuitive)
- ▶ Potential challenges
 - ▶ Focusing only on current status
 - ▶ Different patients having different signs/thresholds
 - ▶ Focusing only on clinical indicators
 - ▶ EHR not bringing abnormal status to attention
- ▶ Implications
 - ▶ Providing information on current status and trend
 - ▶ Alerting clinicians about change of status
 - ▶ Learning and building a library of clinical patterns

Critical Decision Method Interviews

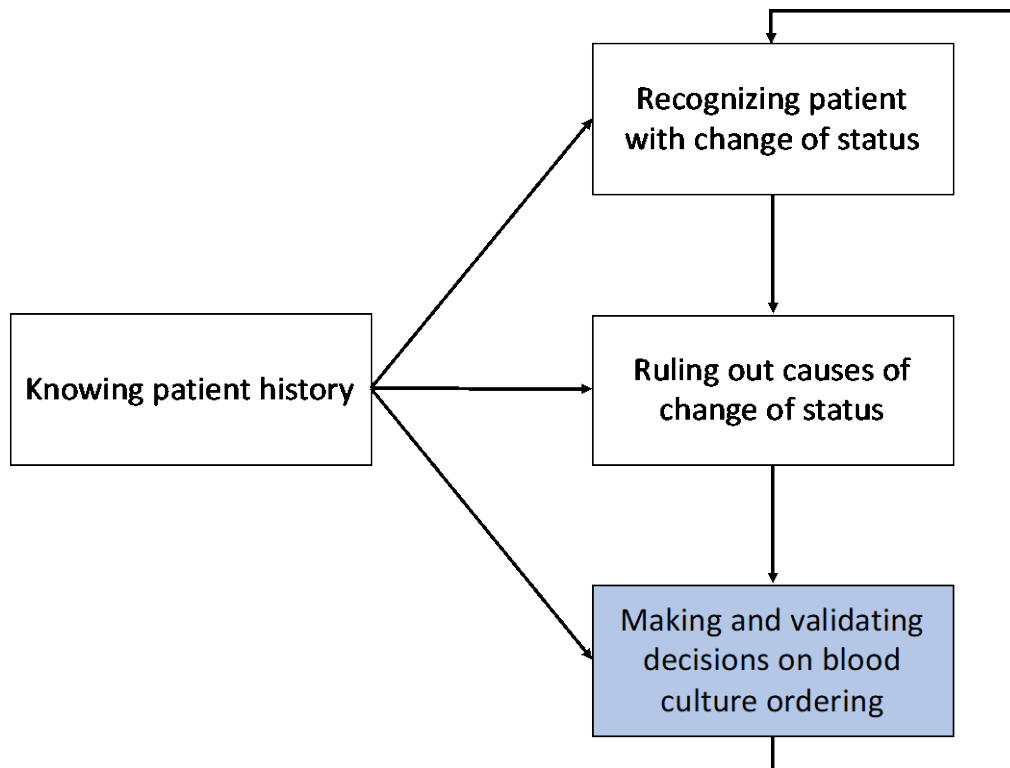

- Results

- ▶ Approaches
 - ▶ Considering potential causes of change of status
 - ▶ Understanding entire condition of patient
 - ▶ Matching patient condition with typical clinical representations of each cause (analytical vs intuitive)
- ▶ Potential challenges
 - ▶ Ordering blood cultures reflexively
 - ▶ Limited knowledge about potential causes and associated clinical representations
 - ▶ Limited time to collect patient information
 - ▶ Mismatch between patient condition and clinical representations because of incomplete information
- ▶ Implications
 - ▶ Indicating all potential causes
 - ▶ Indicating additional information needed and sources of the information

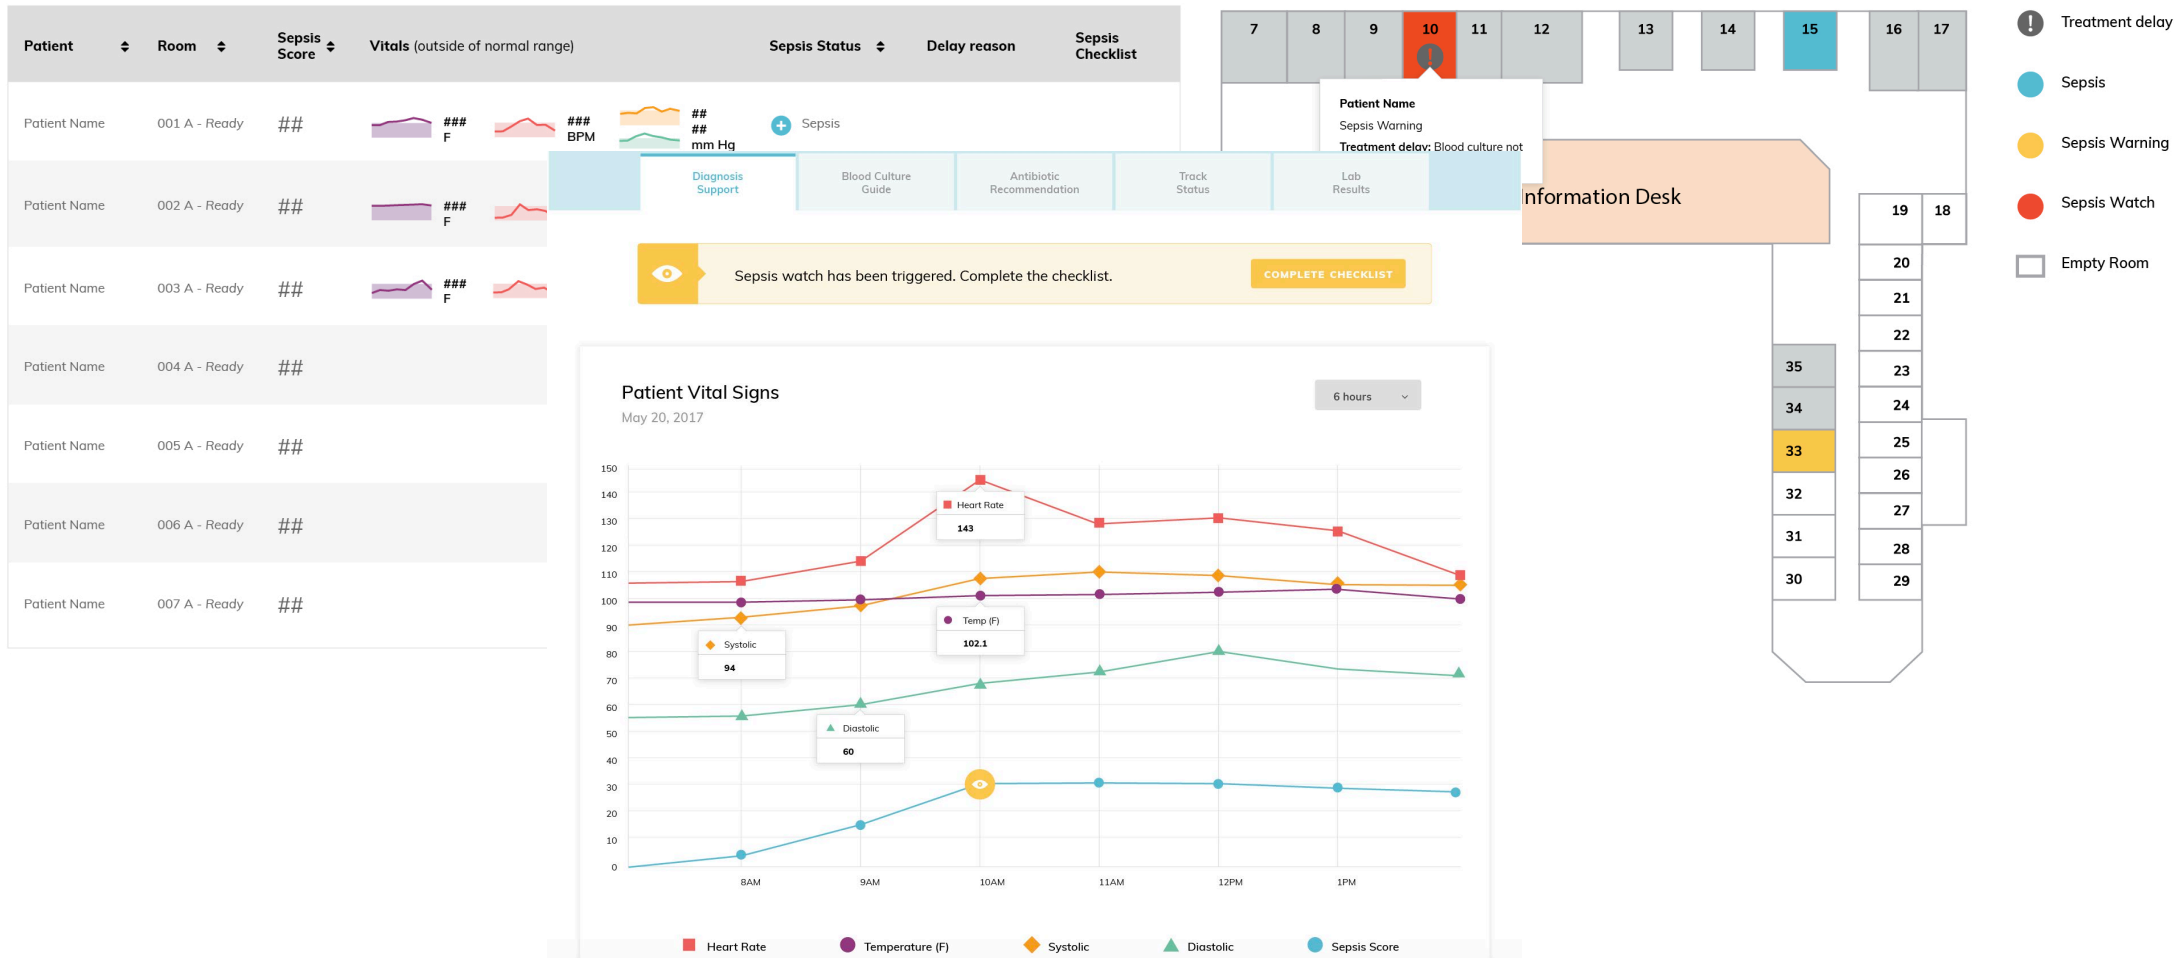

Critical Decision Method Interviews

- Results

- ▶ Approaches
 - ▶ Running decisions by senior physicians
 - ▶ Running decisions by nurse/nurse verifying BC orders
- ▶ Potential challenges
 - ▶ Junior physicians making decisions without the involvement of senior physicians
 - ▶ Senior physicians not challenging decisions made by junior physicians because of mutual respect
 - ▶ Junior physicians not challenging decisions made by senior physicians because of hierarchy
 - ▶ Nurses not challenging decisions made by physicians
- ▶ Implications
 - ▶ Forcing function to get approval from senior physicians
 - ▶ Balancing “hard stop” and “clinical need”

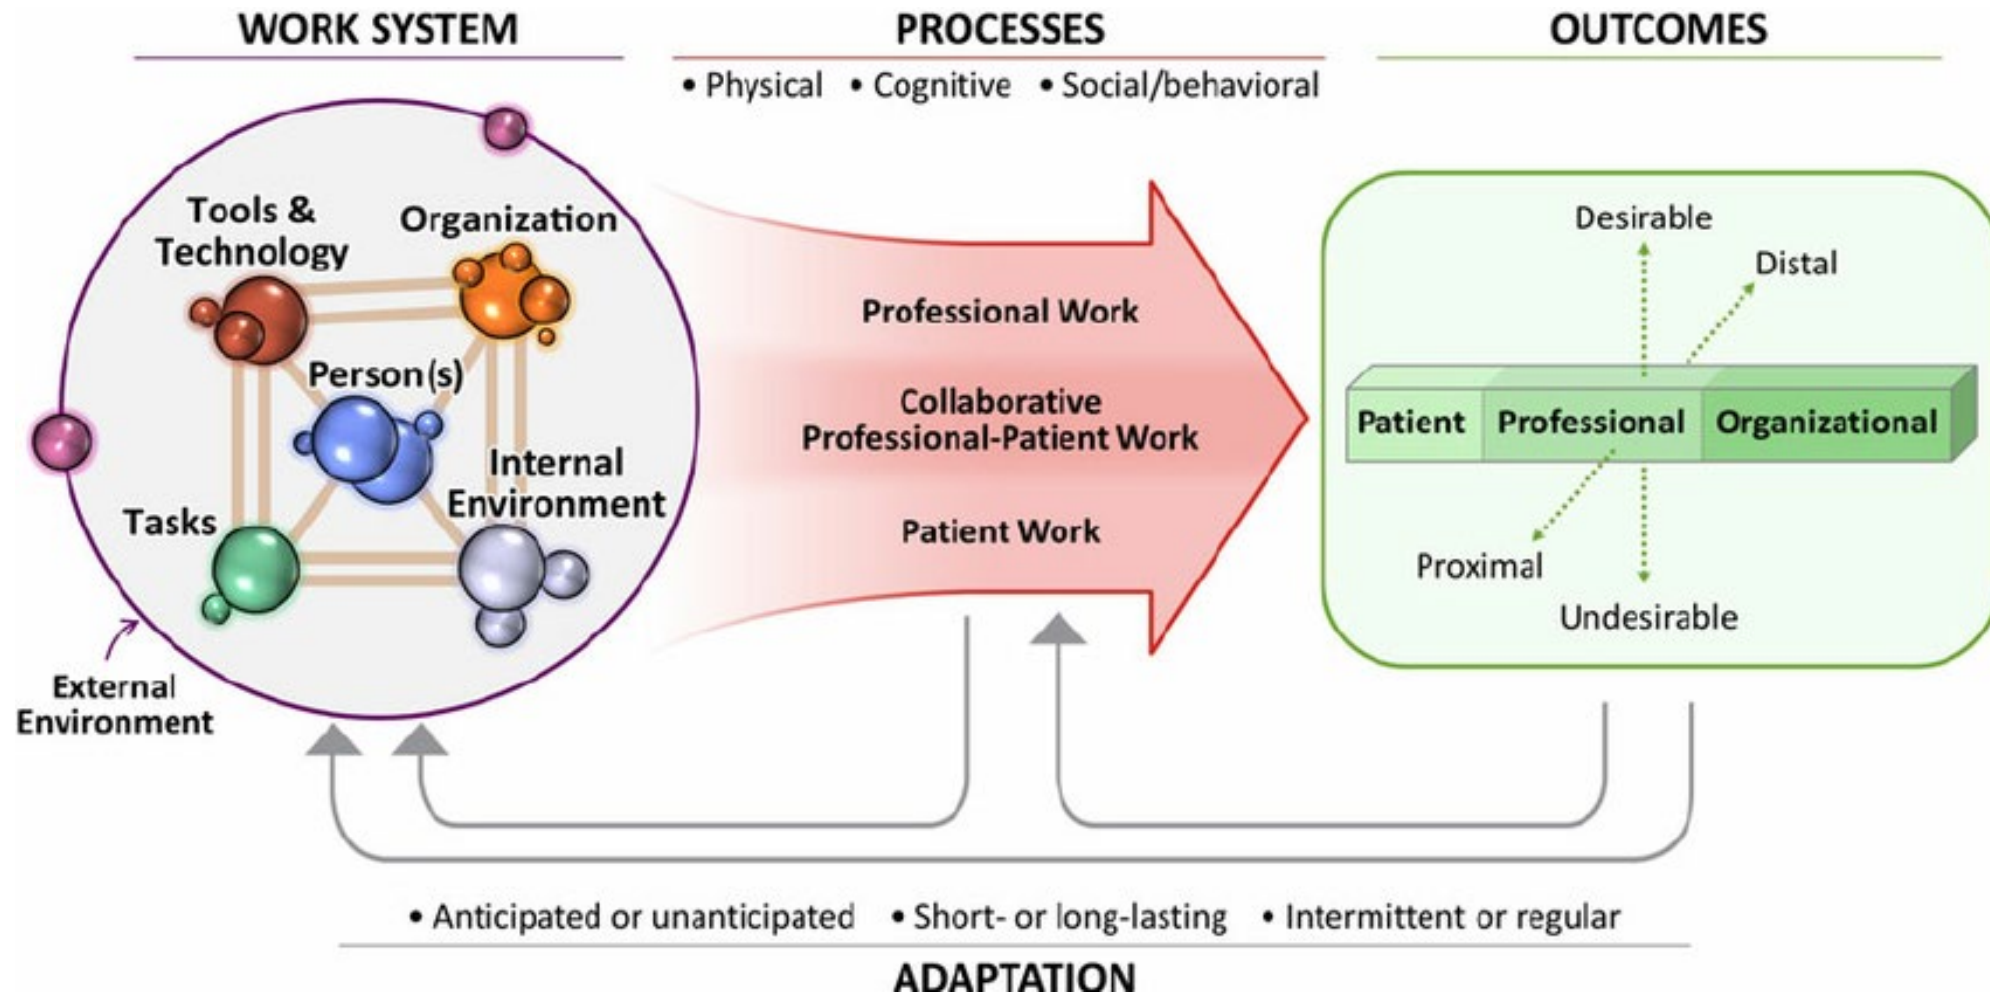

Prototypes

HFE Applications

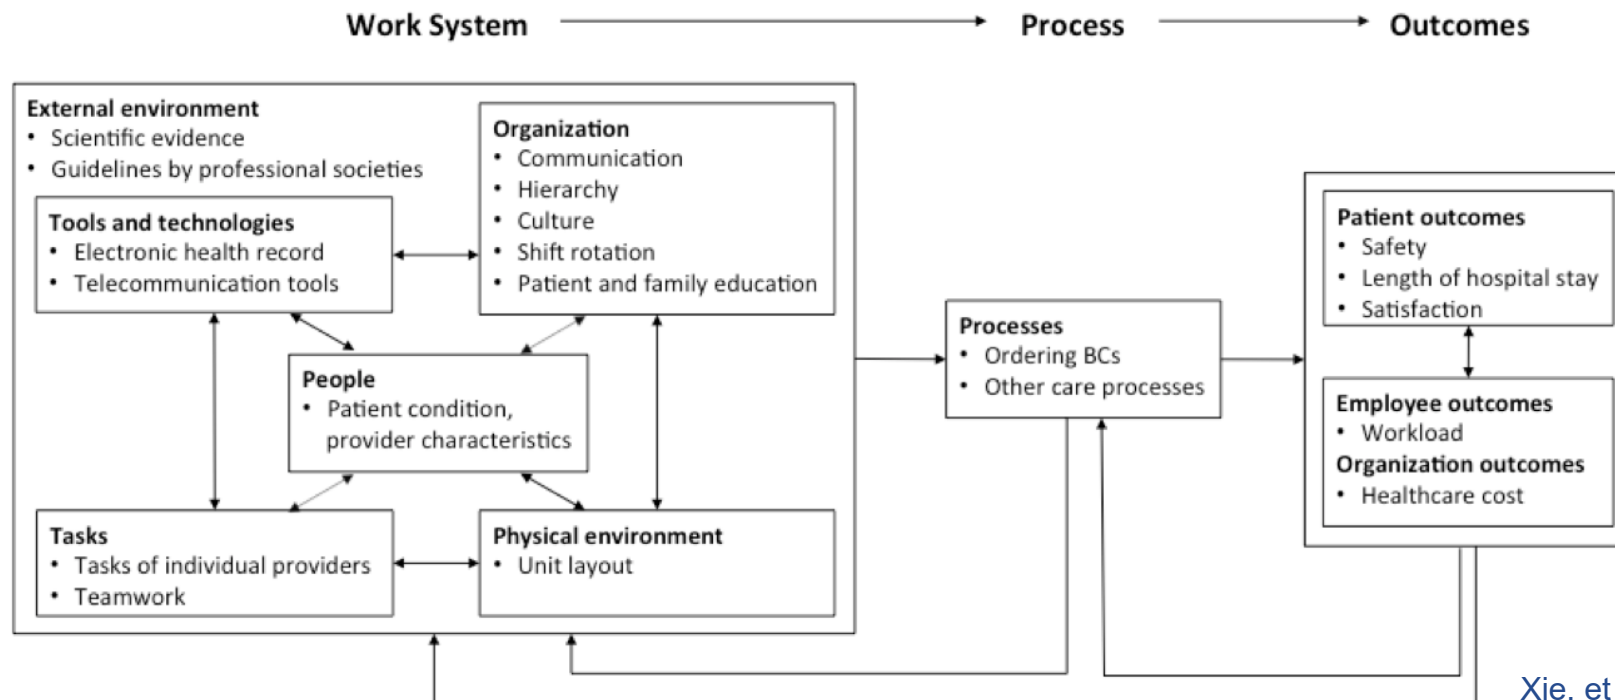

- Integration of the blood culture checklist into electronic health records (EHRs)
- Dissemination of the blood culture checklist

Systems Engineering Initiative for Patient Safety (SEIPS) Model

Early Adoption by Two Hospitals

- Interview-based work system assessment
 - ▶ 2-day visit at each hospital
 - ▶ Face-to-face interviews with different stakeholders

Xie, et al., 2019

Early Adoption by Two Hospitals

- Adaptation of the blood culture checklist to local teams and patient populations
- Customization of implementation strategies
 - ▶ Using the checklist to facilitate clinician communication
 - ▶ Educating clinicians about good blood culture ordering practices and the importance of teamwork to blood culture ordering decision making
 - ▶ Providing clinicians feedback on their blood culture ordering practices
 - ▶ Securing leadership support and identifying unit champions
 - ▶ Changing unit culture to alleviate barriers imposed by organizational hierarchy

Early Adoption by Two Hospitals

Hospital A

Hospital B

Large-Scale Dissemination

- A 15-hospital collaborative
- A participatory ergonomics approach
 - ▶ Identification of physician and nurse champions
 - ▶ Set-up of local quality improvement team
 - ▶ Adaptation of interview-based work system assessment to survey-based work system assessment
 - ▶ Monthly individual and group calls to facilitate the adaptation of the checklist and the redesign of local work systems and processes

AGENCY FOR HEALTHCARE RESEARCH AND QUALITY

Composable Approach in Health IT and Cognitive Support for Clinicians

Yalini Senathirajah, PhD

Associate Professor, School of Medicine
University of Pittsburgh

Co-investigators:

Elizabeth Borycki, RN PhD, *School of Health Information Science, University of Victoria, Canada*

Andre Kushniruk, PhD, *School of Health Information Science, University of Victoria, Canada*

David Kaufman, PhD, *Downstate Health Sciences University, USA*

Kenrick Cato, PhD, *Columbia University, USA*

Objectives

- Describe the composable approach
- Discuss issues related to cognitive support
- Present snapshot of research results (many years)
- Higher-level system advantages of composable architecture
- Future directions
- Discussion

Historical - What Happens When Ordinary People Have Control, Can Create?

- Usability is still problematic in many systems
- Cognitive aspects
- **History: GUI, browser, word processing**
- **Medical: users' specialized expertise not reflected in systems**

What if?

Users could create and share their own data elements, UI?....

- Intelligent use of space
- Human creations in flexible systems beget additional creativity

Doctor, Heal Thyself: Physician Burnout In The Wake Of Covid-19

Lipi Roy, MD, MPH Contributor

Healthcare

I write about medicine, addiction, social justice...& some COVID-19.

Physician burnout and suicide were epidemics before the current pandemic. GETTY

“Nationwide, our doctors are jumping from rooftops, overdosing in call rooms and hanging themselves in hospital chapels. It’s

Nurses protest EHR patient safety risks, healthcare reform woes

Author [Jennifer Bresnick](#) | Date May 27, 2014

National Nurses United (NNU) **has launched** a campaign to protest the patient safety risks inherent in EHR use and the detrimental impact of accountable care reforms on how patients receive inpatient care. Representing a number of state and local nursing organizations, NNU decries the “unchecked proliferation” of EHR technology and the “severe risk of harm” brought about by attempts to significantly reduce hospital admissions and shift care to primary care providers and outpatient settings.

Nanaimo doctors say electronic health record system unsafe, should be shut down

CINDY E. HARNETT / TIMES COLONIST
MAY 27, 2016 06:00 AM

Philosophy

- **Any** element is available to be composed, shared
 - ▶ Analogy: whole genome, some genes are turned on
- **Standardization v. customization – not an issue**
- Customization **in a system made to be customized** is different than ‘EMR optimization’
 - The code doesn’t change., so not a problem.
- **Customization must be easy**– so click/drag, **object manipulation**
 - ▶ Such programming can also be fewer lines, less error prone
- **Assumption in computing – that we can model the process in advance;**
 - ▶ Not always true in healthcare.
- 3rd party visualization
- Control shifted to policy

Display Fragmentation

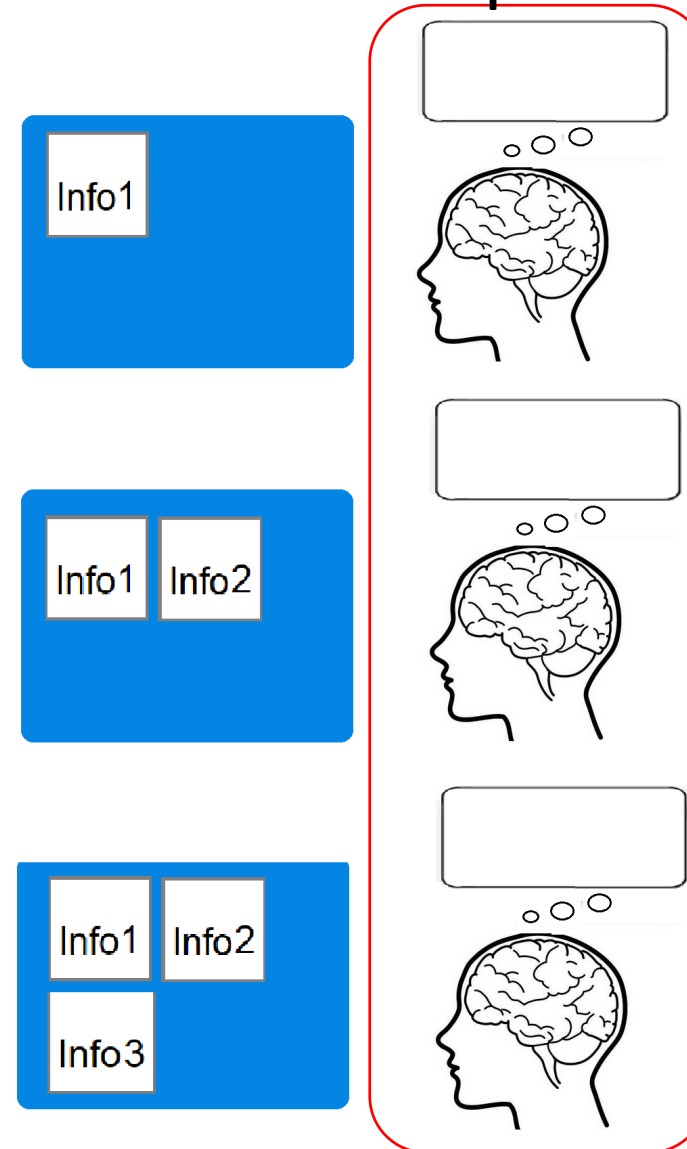

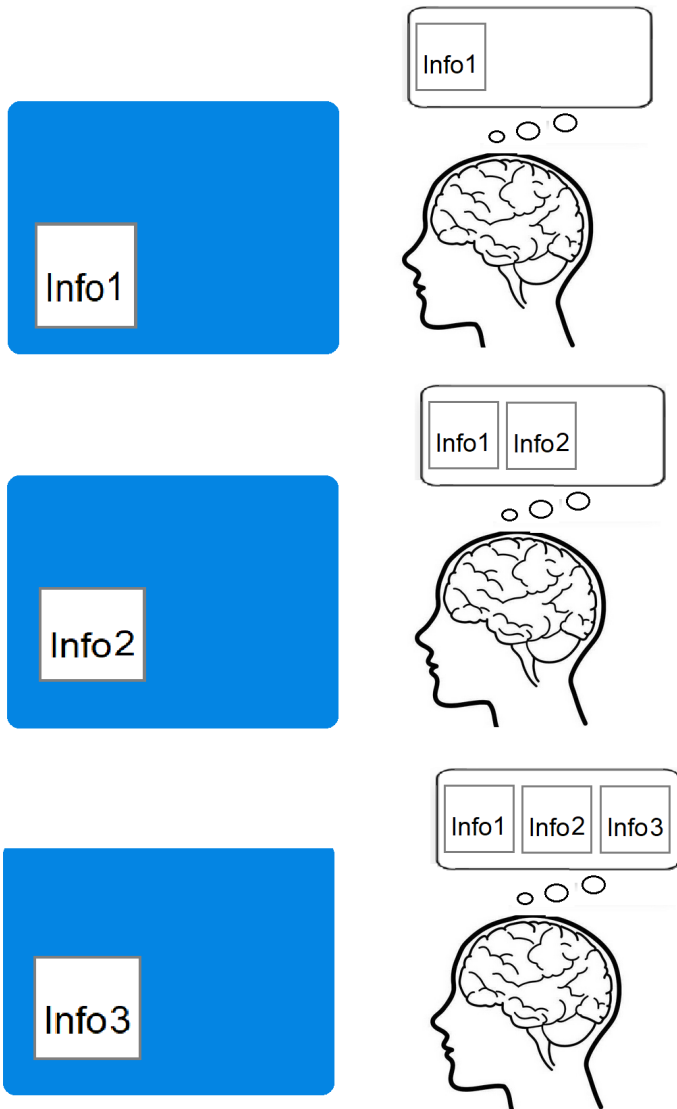

- Perception, attention, memory, are cognitive resources
- Screen transition requires hand-eye coordination → cognitive load
→ interruptive to clinical reasoning

Cognitive load

Cognitive load: conventional v. composable

Admit Note 2/1/16 Pt 10001 John Smith

CC: "Chest pain "

HPI

64 y.o. male smoker with PMH HTN, Type 2 DM, PVD, CAD s/p PCI, GERD was in his usual state of health when he developed sudden chest pain 2 hours prior to initial presentation. He describes the pain as severe, 10/10, sharp/stabbing, localizes it as substernal, radiating to the back. He notes that the pain is exertional and also notes some associated diaphoresis. He denies any SOB but the pain is pleuritic (worse with breathing). He hasn't had similar pain in the past. He denies any recent nausea, vomiting, fever, chills, long flights, recent hospitalizations or operations. He denies any cancer history. He reports taking all medications as prescribed and follows up regularly with his PCP. He took some aleve, but the pain persisted prompting him to come to the ED for further evaluation and pain control.

Covid lab summary

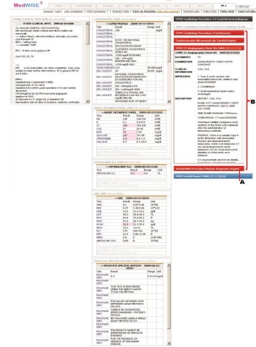

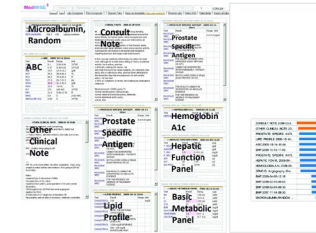

Chest X-ray upright 2/1/16

Early Findings

- 3 strategies of design/interaction
- Juxtaposition as cognitive support
 - ▶ Ordering, reminders, regions, color coding, intelligent uses of space
- 77% decrease in repetitious navigation, up to 6X time savings
- Teams caring for the same patients will jointly standardize display
- Similar diagnostic accuracy
- Checklist effect

Senathirajah Y, Kaufman D, Bakken S. (2014) Clinician in the Driver's Seat: Part 2 - Intelligent Uses of Space in a Drag/drop User-composable Electronic Health Record. J Biomed Inform 52(Dec):177-188. Epub: Oct 2014

Senathirajah Y, Kaufman D, Bakken S. User-composable Electronic Health Record Improves Efficiency of Clinician Data Gathering for Patient Case Appraisal: A Mixed-Methods Study. eGEMs (Generating Evidence & Methods to Improve Patient Outcomes). 2016;4(1):7.

Comments

“...very much appreciate the fact that I can look at an x-ray like within all my other stuff...frustration with [vendor system] is that I’m going back and forth, back and forth all the time, and then visually I can’t see graphically the trends and everything, everything’s going to be text based , I’ll be in the middle of a note and I can’t gather data for somewhere else, and it’s very frustrating.”

“as I’m working a patient and I’m working them up, and I’m writing a note, say I’m writing a note here (motions to right-hand col) and I’m drawing labs, **everything is on one page.**”

- “it’s quicker, I don’t have to click as much, and dig through as much as on ...,”

“widgets which are based on apps for so it's kind of so intuitive...”

EHR Risks (Partial)

Conventional

- Omission by user in search > error
- Cognitive load due to need to retain items in Working Memory
- User viewing patterns hard to view
- Possibly lack of fit to task, specialty, case, role
- No checklist
- Hard to change > potential errors last

Composable

- Omission by user > error?
- Shared omission > Dx momentum error?
- Cognitive load due to UI change?

Senathirajah Y. (2015). Safer design - Composable EHRs and Mechanisms for Safety. Borycki EM, et al., eds., IOS Press. Stud Health Technol Inform 2015;218:40602. PMID:26262532

Senathirajah Y, Kaufman D, Bakken S. Essential Questions: Accuracy, Errors, and User Perceptions in a Modular, User-composable Electronic Health Record. In: Context-Sensitive Health Informatics: Human and Sociotechnical Approaches. IOS Press. Stud Health Technol Inform 2013;194:181-187.

Composable Systems - Usability and Safety Studies

- ▶ Eye tracking – what UX design aspects are cognitively loading?
 - (orders, results, documents., flowsheets, patient list, summary)
- ▶ Effects of user UI sharing – omissions, errors, transfers?
- ▶ Crossover studies – comparison of conventional v. composable EHR UI
- ▶ ED simulation - interruptions in high-stress scenarios, multiple patients and EHR record switching

What Features Are Most Cognitively Loading in EHRs? Solutions?

- Interview/observation/eye tracking neuro nurses, ICU/ED docs (n=9) doing 6 tasks
- UX issues:
 - ▶ Long document lists – double click–
 - too long- omission of info
 - ▶ Flowsheet filling
 - ▶ Orders
- As per user:
 - ▶ pain assessment documentation, admissions

Pupils dilate with increased mental effort
Software subtracts effects of lighting - a more objective measure of cognitive load?

Patient Information ^

☐ Patient History
☐ Medications
☐ Review of Systems
☐ Health Maintenance
☐ Family History
☒ Vitals
☒ Assessment
☒ Plan

07:30 AM

Assessment
EKG (#24) sinus tachycardia with incomplete RBBB, nonspecific ST and T wave changes
CXR (#51) widened mediastinum BP in both arms
Right 140/100 Left 185/118
DDimer elevated 2300

Plan

- 2 large bore IV's
- Cardiac monitor and pulse ox
- EKG (EKG # 24)
- Chest x ray (CXR # 51)
- Type and cross

01:30 AM

Plan

- Blood pressure management (labetolol or nitroprusside and esmolol)
- Continuous vital monitoring
- Telemetry monitoring
- Supplemental O2
- Place pads on chest
- Serial trops
- Emergency consultation- Vascular Surgery
- Diagnostic imaging considerations (patient needs Chest CT or Transthoracic Echo)

April 9th, 2019

Assessment
EKG (#24) sinus tachycardia with incomplete RBBB, nonspecific ST and T wave changes
CXR (#51) widened mediastinum BP in both arms
Right 140/100 Left 185/118
DDimer elevated 2300

Plan

- 2 large bore IV's
- Cardiac monitor and pulse ox
- EKG (EKG # 24)
- Chest x ray (CXR # 51)
- Type and cross

Solution? Use google maps-like navigation frame; automatic cursor focus as one proceeds.

[illegible]

Info transmission + Error/Omission Detection

- Default layouts, deliberate error, omission, confusing/contradictory note
- No information distortion in transmission
- **Users either detected and mentioned omissions/errors, or did not mention them but made correct diagnoses (23/44 case sessions)**
 - ▶ Was a main objection to this approach
- Times shorter than:
 - ▶ User doing composing
 - ▶ Conventional EHR review.

Avg Time (sec)	Case 1	Case 2	Case 3	Case 4
Composed	420	376	736	434
Conventional	441.4	518.8	828.33	497.5

Crossover Study

- 31 subjects, 4 cases, Latin squares 2x2 crossover study (2 in MedWISER, 2 in commercial ambulatory EHR)
- **Thinkaloud protocol** – user asked to assess case, think aloud, state essential actions, Dx, Tx
- Screen recordings coded for clinical reasoning, UI/UX actions, time on task, debriefing survey

PMD note outpatient 07/12/2014
Mr. Smith is a 64 y.o. male smoker with PMH HTN, Type 2 DM, PVD, GERD who presents today for routine follow up. Patient states that he is feeling well but with remains with some of his usual intermittent leg cramping since the surgery (he recently had a femoral bypass (05/04/2014)). He endorses medication compliance with all of the "blood thinners" prescribed at that time. He has some nausea lately and notices an increase in his reflux symptoms. We decided to try different food (less spicy, behavioral modification) on last office visit, but patient notes that this is not working anymore. He has tried to cut down on smoking but remains at 10-15 cigarettes per day. He expresses a desire to lose weight but isn't ready to modify diet or exercise more as work has been more stressful lately. He denies any recent palpitations, chest pain, dyspnea on exertion or recent vomiting.

Vitals:
153/49 HR 75 O2 Sat 95% RA RR 14
General: NAD, well-appearing male, A&O x 3
HEENT: OP clear, MMM, PERRL, EOMI
Neck: Supple, no lymphadenopathy appreciable
CV: RRR, no murmurs, rubs or gallops, no

Stated Cognitive/Experience Advantages

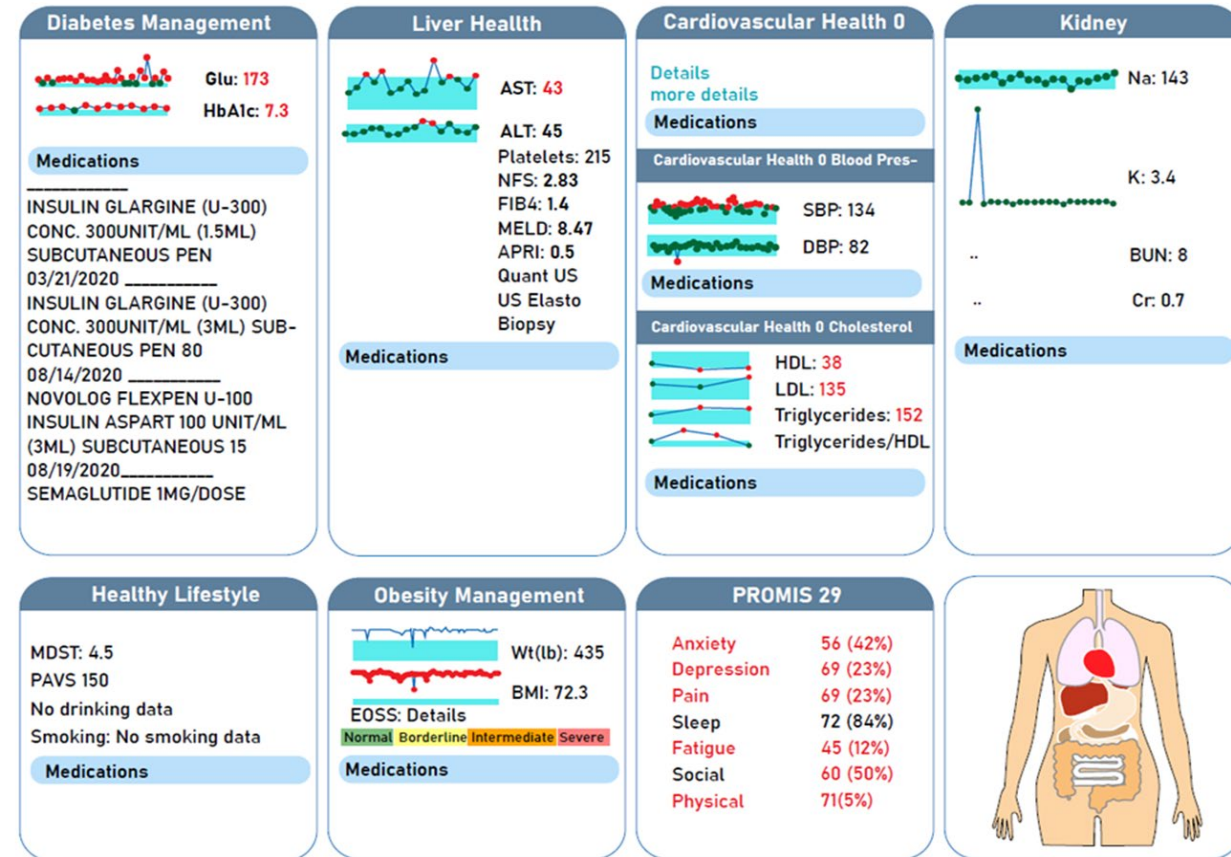

- **See all relevant data together, no disruption in thinking**
- Communication with colleagues and future self informally
 - ▶ Unofficial side channel is important
- Jointly standardize what they need
- Visualizations conducive to pattern detection
- Fit to task for clinical reasoning – different than machine predictive delivery
- Time savings
- Checklist effect

5 rights of CDS

- Right **information**
- Right **time**
- Right person
- Right channel
- Right **format**

What if:

- Fast CDS set up?
- Combine CDS AI recommendations +
other data rapidly?
- Display patient-reported data with EHR data?

Pros and Cons of Conventional v. Composable

Pros – Conventional	Pros - Composable
<ul style="list-style-type: none">• Control by vendor, institution• Large installed base• Common “standard” UI (until upgrade)	<ul style="list-style-type: none">• Partial user control (within limits)• Patient-specialty-and content-specific displays• Shared creations• Time efficiency/6x savings• Communication collaboration – common ground displays• Rapid change – meet new needs, safety (suboptimal exposure)• Fit to task, rapid testing• Cognitive support – low display fragmentation• Information exchange; medical knowledge embodied in code• Possible standardization of UI• Lower burden on IT staff• Easily incorporate new 3rd party visualizations, other tools
Cons – Conventional	Cons – Composable
<ul style="list-style-type: none">• Rigid UI and information selection• Display fragmentation -> cognitive load• Can’t share user work, creations• Cross-user communication may be hard	<ul style="list-style-type: none">• New type of system, minimal training required• Conventions may be required in institutional rules• Not necessarily standard or may not be understood• Restriction may be required for specific needs

The Value of Flexible User-Controlled Architecture, Rapid Change

- Resilience – we don't know what new needs arise
 - ▶ Pandemic response
 - Covid19 initial – minutes
 - Covid19 with blood clots - 25sec
- Audience – new use cases – most interesting
 - ▶ e.g., transitions of care, rapid Covid appraisal, ED decisions/trauma, oncology
- Ease of incorporating new things
 - ▶ Visualizations,
 - ▶ New AI recommendations (just switch in a tile + add'l requirements)

NASA MCT - Multi-Domain Composition

Meets their needs for

- **Reliable extensibility with low risk**
- **components certified → low maintenance /new item costs**
- **fast innovation, fit to user needs**

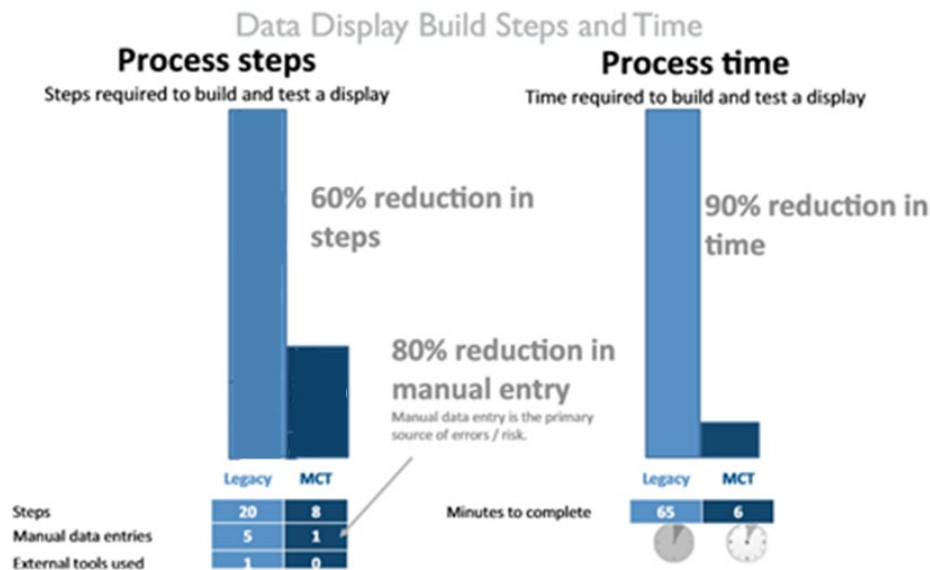

Figure 11. Time and process reduction in display build time measured by one customer

60-90% time/costs reduction

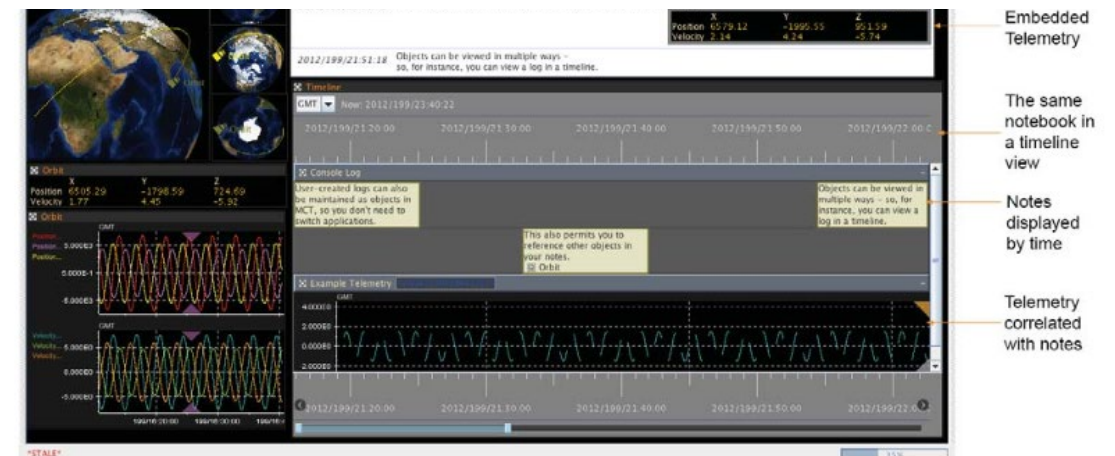

Figure 9. A multi-domain composition showing plots, timelines, logs, orbits, and data correlation over time

To Decrease Cognitive Load:

- Juxtapose information used together
- Consider permitting users to have some way to arrange, mark
 - ▶ Presented as option, not burden
- Shareability
- Left-right pattern of **orientation, data, decision/action**
- Allow different info types on same page (e.g., Xray + note)
- 3rd party visualizations which aid pattern detection
- ****user control may have morale effects, variable use**

Wrap Up

- **Looking for collaborations**; esp. those which can implement;
- **Vendors** – if you like these ideas, collaborate with us
- This is a building/usage method - focus on how the whole system works in real work.

PMID: 21893757

Architectural and usability considerations in the development of a Web 2.0-based EHR

[Yalini Senathirajah](#)¹, [Suzanne Bakken](#)

Abstract

Healthcare information system variability, and rapid change in approaches commonly termed adaptive architecture. The vision make all necessary information for the user to use, arrange, reconfigure, and make it more advisable. Clinicians can create domain knowledge and cater to the intervention of programmers. We have built an example system, MedWISE, embodying facing parts of the model. This approach to HIS is expected to have several advantages: greater suitability to user needs (reflecting clinician rather than programmer concerns).

Affiliations + expand
PMID: 19380954

Abstract

In our previous work, we described an electronic health record architecture and its principles. With this architecture, users in healthcare can control the information and interfaces they use by means of a simple, flexible, and scalable architecture. We have built an example system, MedWISE, embodying facing parts of the model. This approach to HIS is expected to have several advantages: greater suitability to user needs (reflecting clinician rather than programmer concerns).

5th Human Factors Engineering in Health Informatics Symposium, Trondheim, Norway 2011

When speed is essential: Rapid configuration of a user-configurable 'web 2.0' based EHR for H1N1 decision support

[Yalini Senathirajah](#), [David Kaufman](#), [Suzanne Bakken](#)
Columbia University Department of Biomedical Informatics

Abstract

We have proposed that widget-based systems, which allow the user to select, arrange, modify, share, and create clinical and other health information, can have several advantages over conventional systems[1, 2] including better fit with user domain knowledge, integration of clinical and external information, better collaboration and communication, and adaptability to rapid change. We describe a study in which the system was rapidly configured to provide decision support for primary care clinicians treating patients suspected of H1N1 infection, based on emerging guidelines from the Centers for Disease Control (CDC) in the United States.

How to Submit a Question

- At any time during the presentation, type your question into the “Q&A” section of your WebEx Q&A panel
- Please address your questions to “All Panelists” in the drop-down menu
- Please include the presenter’s name or their presentation order number (first, second, or third) with your question
- Select “Send” to submit your question to the moderator
- Questions will be read aloud by the moderator

A screenshot of the WebEx Q&A panel. At the top, it says "Q & A" with a dropdown arrow and a close button. Below that, it says "All (0)". There is a large text input area. At the bottom of the input area, it says "Select a question and then type your answer here, There's a 512-character limit." Below the input area are two buttons: "Send" and "Send Privately". At the very bottom, there are three tabs: "Participants" (selected), "Chat", and a menu icon (three dots).

Obtaining CME/CE Credits

If you would like to receive continuing education credit for this activity, please visit:

hitwebinar.cds.pesgce.com

The website will be open for completing your evaluation for 14 days; after the website has closed, you will not be able to register your attendance and claim CE credit.
